## Lecture 16 — Real-Time Scheduling Algorithms

Jeff Zarnett jzarnett@uwaterloo.ca

Department of Electrical and Computer Engineering
University of Waterloo

April 29, 2023

ECE 350 Spring 2023 1/49

#### **Onward Then**

We talked about what makes scheduling for real-time systems different.

We already covered timeline scheduling.

Let's go back to the uniprocessor world to start...

ECE 350 Spring 2023 2/49

The earliest deadline first algorithm is, presumably, very familiar to students.

ECE 350 Spring 2023 3/49

Assignment due today, an assignment due next Tuesday, and an exam next month, then you may choose to schedule these things by their deadlines.

Do the assignment due today first.

After completing an assignment, decide what to do next (probably the new assignment, but perhaps a new task has arrived in the meantime?) and start.

ECE 350 Spring 2023 4/49

The principle is the same for the computer.

Choose the task with the soonest deadline; if there is a tie, then random selection between the two will be sufficient (or other criteria may be used).

ECE 350 Spring 2023 5/49

If there exists some way to schedule all the tasks such that all deadlines are met, this algorithm will find it.

If a task is executing and another task arrives with a sooner deadline, the currently executing task should be suspended and the new task scheduled.

This may mean a periodic task being preempted by an aperiodic/sporadic task.

ECE 350 Spring 2023 6/49

## Implementing EDF

A priority queue is reasonable...

Sort by deadline? Does that account for task type?

Ah, but what if we're overloaded...?

ECE 350 Spring 2023 7/49

## **Deadline Interchange**

This deadline-based approach is subject to a problem that very much resembles priority inversion.

ECE 350 Spring 2023 8 / 49

## **Deadline Interchange**

Suppose a task A has locked a mutex and then a new task B arrives that also needs that mutex and has a sooner deadline than A.

Task A would therefore be preempted in favour of B, at least until B gets blocked.

If there are other tasks C, D, E... that also want this resource, A could be waiting a long time to proceed.

Even if B misses its deadline!

ECE 350 Spring 2023 9/4

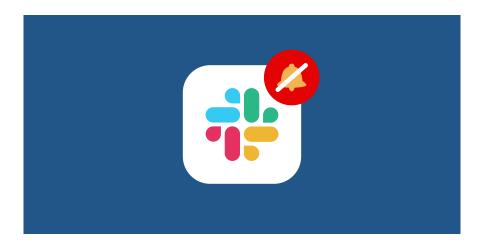

## **Deadline Interchange**

The best way to make that happen would be to assign to A a new deadline, specifically the soonest deadline from all the tasks waiting for it.

Doesn't that look like priority inheritance?

ECE 350 Spring 2023 10/49

A similar algorithm to earliest deadline first, is least slack first.

ECE 350 Spring 2023 11/49

#### **Least Slack First**

Slack: how long a task can wait before it must be scheduled to meet a deadline.

If a task will take 10 ms to execute and its deadline is 50 ms away, then there are (50 - 10) = 40 ms of slack time remaining.

Start the task before 40 ms are expired if we want to be sure that it will finish.

ECE 350 Spring 2023 12/49

#### **Least Slack First**

This does not mean, however, that we necessarily want to wait 40 ms before starting the task (even though many students tend to operate on this basis).

All things being equal, we prefer tasks to start and finish as soon as possible.

It does, however, give us an indication of what tasks are in most danger of missing their deadlines and should therefore have priority.

ECE 350 Spring 2023 13/49

### Rate-Monotonic Scheduling

The name doesn't explain this one super well.

EDF and LSF don't really consider priorities.

Rate-Monotonic scheduling is based around the idea of basing priority on the period – tasks that execute more often are given higher priority.

ECE 350 Spring 2023 14/49

### **Not Quite Optimal**

This algorithm is, however, not perfect.

It's possible to fail to schedule things in such a way that all tasks meet their deadlines even if utilization is less than 1.

Example: n periodic tasks with the form  $(C_k, \tau_k)$ : (1, 4), (3, 7), and (3, 10).

ECE 350 Spring 2023 15/49

### That's Not Supposed to Happen

Utilization is less than 1 so it should be possible to solve this one: (1/4 + 3/7 + 3/10 = 137/140).

Earliest Deadline First would have been able to schedule this such that it met all deadlines.

ECE 350 Spring 2023 16 / 49

To figure out if it's possible to schedule things, there's a test.

It turns out that it's very difficult to do this dynamically in real-time, so we have to use a less-precise formula.

$$\Pi_{k=1}^n (1+\frac{c_k}{\tau_k}) \leq 2.$$

Remember: uncertain success is not certain failure.

ECE 350 Spring 2023 17/49

#### **Deadline Monotonic**

A variant of this is deadline-monotonic scheduling, in which case priority is assigned based on deadlines.

The task with the shortest deadline is assigned the highest priority.

ECE 350 Spring 2023 18 / 49

## **Aperiodic Servers**

A task with a soft deadline is challenging to schedule here, because it's hard for the scheduler to know whether a task is soft- or hard-real time.

One possibility is to say that aperiodic or soft-deadline tasks are always lower in priority than any firm- or hard-real time task.

ECE 350 Spring 2023 19/45

### **Polling Server**

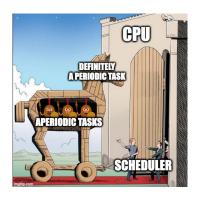

A polling server is, in its own way, a little container in which aperiodic tasks occur.

The server is itself a hard-deadline periodic task with a fixed execution time budget and a deadline equal to its period.

ECE 350 Spring 2023 20 / 49

#### **Periodic Server**

During the execution time of the server task, the aperiodic tasks waiting will run sequentially.

ECE 350 Spring 2023 21/49

#### Too Much or Too Little

If there are too many tasks or they otherwise take too long and they do not finish, the aperiodic tasks just carry over to the next time the server runs.

If there are not enough aperiodic tasks and there's time left over, just end the server task execution (throw away the extra time) and let something else run.

ECE 350 Spring 2023 22 / 49

## Periodic Server Analogy

Do you have to use your lunch break for eating lunch?

ECE 350 Spring 2023 23/49

## **Multiple Servers**

We can have different servers that work on different kinds of tasks.

In the lunch break analogy, what if there's lunch breaks and coffee breaks?

ECE 350 Spring 2023 24/49

#### Does It Work?

Polling server does not affect the ability of the system to complete the hard-deadline tasks.

The background server's behaviour is predictable!

Downside: response time for aperiodic tasks.

ECE 350 Spring 2023 25 / 49

#### Variant: Deadline-Deferrable

Improved version: deferrable server.

Instead of throwing away the time budget if it's unused at the end of the period and there's nothing to do, save that leftover time.

Either the time is used up or eventually expires.

ECE 350 Spring 2023 26 / 49

#### **Deferrable Server**

Finished with 40% budget remaining?

Polling server: Throw it away.

... Back to work even if lunch finished in 45 minutes; 15 mins lost.

Deferrable server: Keep it until the end of the period.

Save those 15 minutes for later in the day, but can't carry over to tomorrow.

ECE 350 Spring 2023 27 / 49

## Reminder: Consult a Lawyer

Note that none of this is a substitute for legal advice from an employment lawyer about the rules & regulations around legally required breaks during the workday.

ECE 350 Spring 2023 28 / 49

## Variant 2: Deadline-Sporadic

Next idea: sporadic server!

Instead of losing the extra unused period, it can be saved, indefinitely.

The replenishment of the budget forces execution to be spread out more evenly.

ECE 350 Spring 2023 29/49

## Why Does Spreading It Matter?

ECE 350 Spring 2023 30 / 49

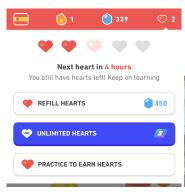

## Spreading It Out

Execution time for the server is broken down into chunks.

When a chunk is depleted, it's scheduled for replenishment in the future.

ECE 350 Spring 2023 31/49

## Replenishment is Familiar Maybe

# Startup founders after they run out of free AWS credits

ECE 350 Spring 2023 32/49

## Variant 3: Deadline Exchange Server

Like Deadline-Deferrable server, but simplifies tracking the chunks.

Any remaining execution time is discarded when the request queue is empty and the wait for replenishment is based on the last chunk of execution time used.

This is simpler to implement since there's only ever one replenishment to track and the replenishment is always the full quota.

ECE 350 Spring 2023 33/49

#### **But Does it Work?**

Simulation studies show that different forms of the period server approach are effective for different workloads.

Remember: it's possible to have different servers configured for different aperiodic tasks to give the best balance of prioritization and performance.

ECE 350 Spring 2023 34/49

## Multiprocessor Math

Now it's time to get out of uniprocessor and into multiprocessor scheduling.

Task  $\rightarrow$  things that need doing.

Job  $\rightarrow$  specific instance of the task to run.

ECE 350 Spring 2023 35 / 49

## **Three Relevant Questions**

Is preemption permitted?

Is job migration permitted?

Is job parallelism permitted?

ECE 350 Spring 2023 36/49

#### This Is Mine And You Can't Have It

Dedicated CPUs are an option, possibly with manual assignment.

That makes it more like the uniprocessor situation.

Working for 5 years can
either mean you have five
years of experience or one
year of experience repeated
five times

ECE 350 Spring 2023 37/49

# Computer, Please Help

Asking the computer to do it? This is one of those NP-Complete problems.

Doing so in advance for an all-periodic system is doable.

For systems with sporadic and aperiodic tasks, the cost of doing this math might be prohibitive at runtime.

ECE 350 Spring 2023 38 / 49

# Migration

No migration does mean that there is a possibility that tasks are failing to meet their deadlines on CPU X for lack of CPU time...

Even though CPUs Y and Z have plenty of idle capacity.

Things are more interesting if there is migration allowed.

ECE 350 Spring 2023 39 / 49

### It's Free Real Estate

Simple analysis: there's no cost to migrating a task from one CPU to another.

We know that's not true just because of cache misses.

So, do we allow migration or not?

ECE 350 Spring 2023 40 / 49

# Back Up a Step

Option 1: Global scheduling; all tasks go in one queue.

Option 2: Partitioned scheduling; tasks statically assigned to a CPU.

Research shows this approach may only allow 50% utilization.

ECE 350 Spring 2023 41/49

### Next Idea?

What about half-and-half? Semi-partitioned scheduling.

Some tasks are fixed to specific processors, some may move.

Intuitively this seems it might work.

ECE 350 Spring 2023 42/49

### Beg Your Pardon M'Lord?

None of these approaches are actually solutions that ensure we have an optimal scheduling for multicore system.

What we need is a different approach...

ECE 350 Spring 2023 43 / 49

#### **P-Fairness**

The P in P-Fair scheduling stands for "proportional" and the goal is to allocate CPU time in such a way that tasks make progress at steady rates.

An application can request time  $x_i$  time units every  $y_i$  time quanta (time slices).

The system guarantees over any T quanta (T>0) then a continuously-running application receives between  $\lfloor x_i/y_i \times T \rfloor$  time and  $\lceil x_i/y_i \times T \rceil$  quanta of service.

ECE 350 Spring 2023 44/49

The term lag is used to reflect the difference between the allocated CPU time and the time the task should have.

Lag greater than 0? Needs more CPU time.

Lag less than 0? Has had more than it should have.

ECE 350 Spring 2023 45 / 49

#### **Task Classification**

A task is urgent if it has lag above 0;

A task is tnegru is its lag is negative.

ECE 350 Spring 2023 46 / 49

# P-Fair Algorithm

Then the scheduling algorithm consists of three parts:

- Schedule all urgent tasks.
- 2 Do not schedule tnegru tasks.
- 3 Schedule other tasks in order of highest lag to lowest until capacity is filled.

Goal: keep the lag between -1 and +1 for all tasks!

ECE 350 Spring 2023 47/49

### Analysis of P-Fair

Each task is broken down into small slices and each subtask executes on the CPU when it can, before its deadline.

Wasted spaces is limited.

A P-Fair schedule is always periodic.

ECE 350 Spring 2023 48/49

### **Analysis of P-Fair**

There exist a number of papers building on the P-Fair approach to address some of its shortcomings and adapt it to some more scenarios.

It does require a lot of computation at each timeslice.

Is it worth it? It's a lot better than losing 50% of capacity...

ECE 350 Spring 2023 49 / 49
